## Test Procedure

A spectrum analyzer is used as a monitor verifies that the EUT status including Channel Closing Transmission Time and Channel Move Time, and does not transmit on a Channel during the Non-Occupancy Period after the detection and Channel move. It is also used to monitor EUT transmissions during the Channel Availability Check Time.

## DFS Implementation

Please refer to the block diagram:

## TEST RESULTS

### Description of EUT

The EUT operates in 5470-5725 MHz (without 5600-5650MHz) range when performing DFS testing.

The calibrated radiated DFS detection threshold level is set following ETSI EN 301 893 V2.1.1 (2017 -05) Annex D for this band.

WLAN traffic is generated by streaming the video file “Test File.mpg”, this file is used by IP and Frame based systems for loading the test channel during the In-service compliance testing of the U-NII device. The file is streamed from the Access Point to the Client in full motion video mode using the media player with the V2.61 Codec package.

## Radar Waveform Calibration

$$DFS \text{ Detection Threshold (dBm)} = -62 + 10 - e.i.r.p. \text{ Spectral Density (dBm/MHz)} + G \text{ (dBi)}$$

Where,

*e.i.r.p. Spectral Density (dBm/MHz)* is 13.97dBm/MHz;

*G (dBi)* is 12dBi.

So,

$$DFS \text{ Detection Threshold (dBm)} = -62 + 10 - e.i.r.p. \text{ Spectral Density (dBm/MHz)} + G \text{ (dBi)} = -53.97 \text{ dBm/MHz} \approx -54 \text{ dBm/MHz}$$

**Channel Move Time and Channel Closing Transmission Time****Test Procedure:**

Perform radar at a level of 10 dB above the level defined in clause 5.3.8.2.1 on the selected channel.

Aggregate Transmission Time =  $N * \text{Dwell Time}$

N is the number of spectrum analyzer bins showing a device transmission

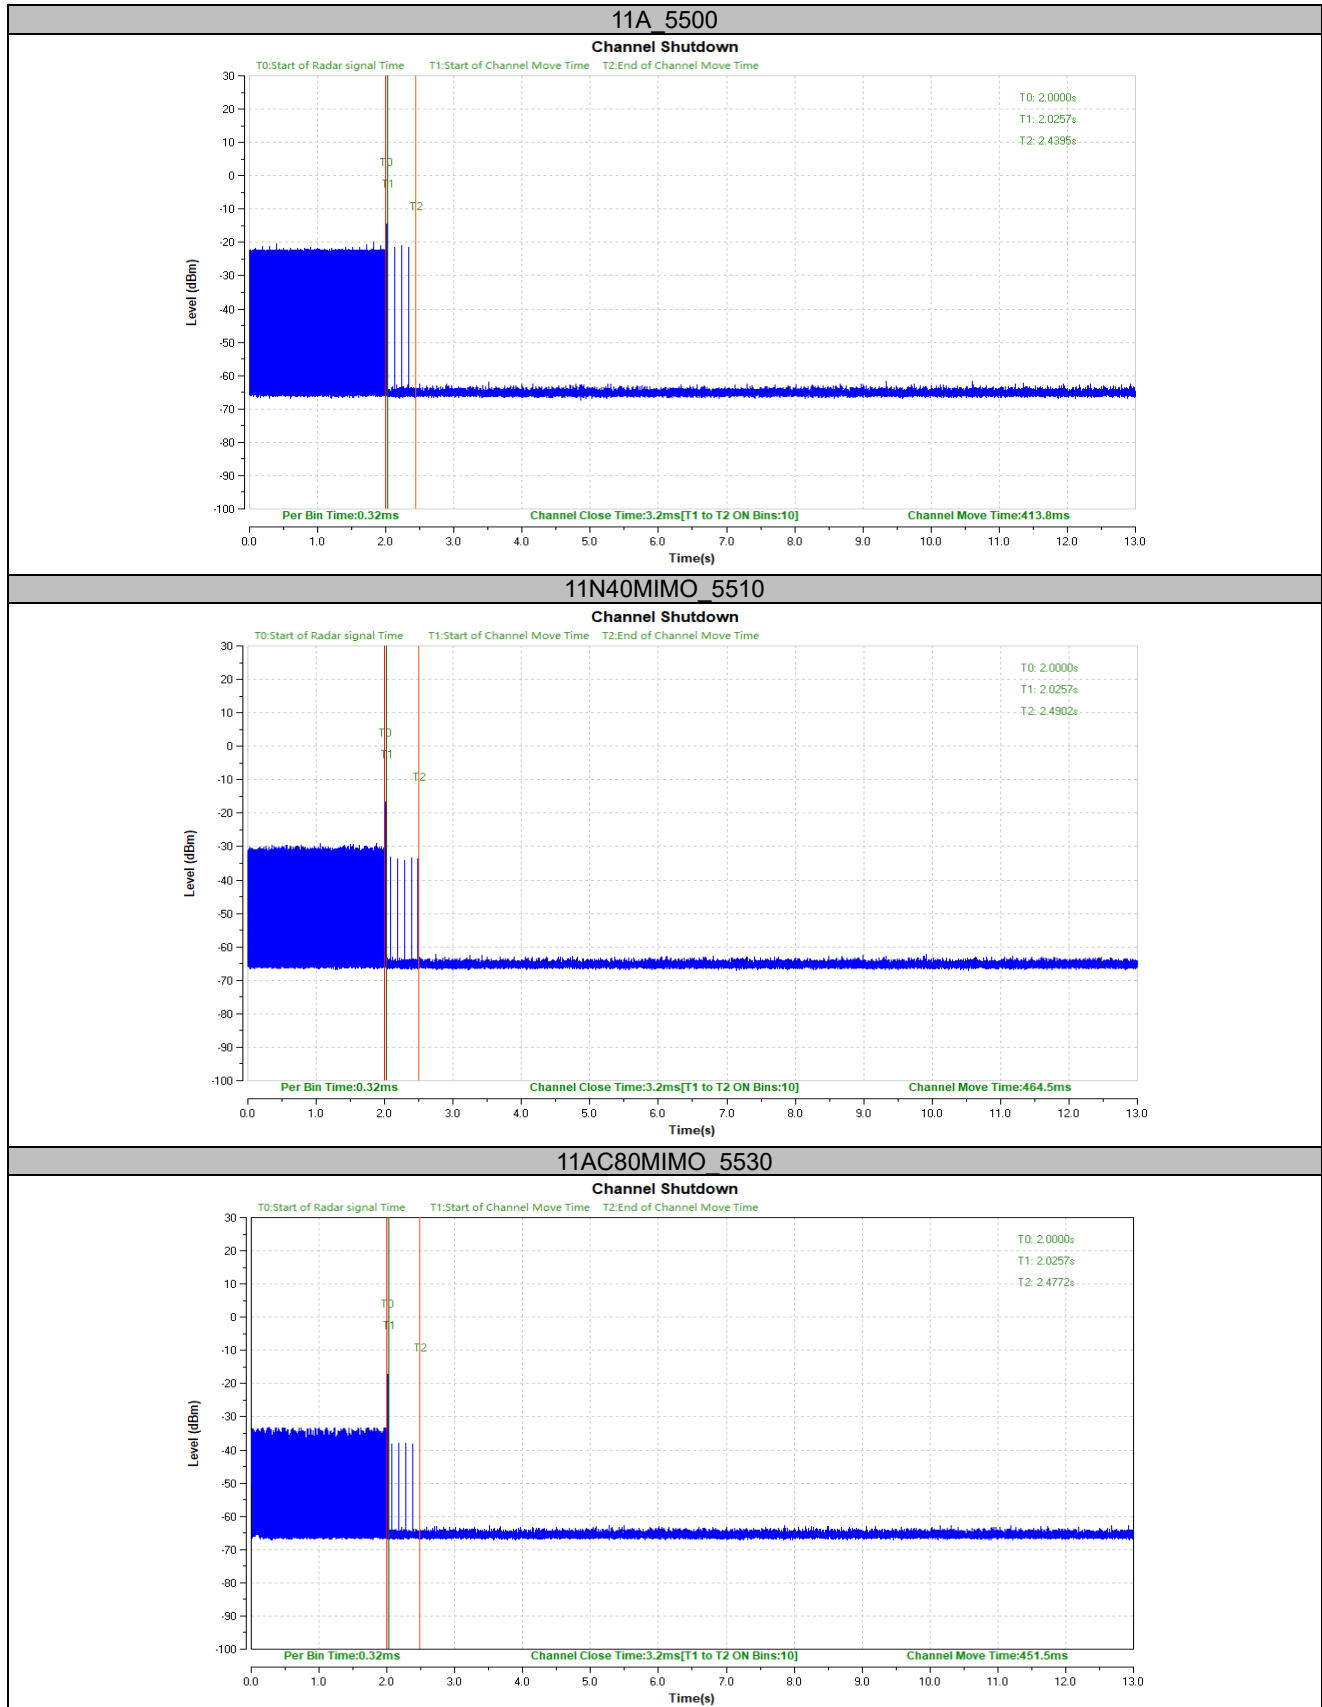

Dwell Time is the dwell time per bin (i.e.  $\text{Dwell Time} = S/B$ , S is the sweep time and B is the number of bin, i.e. 8192)

**Results:**

11AC80MIMO	5530	3.2	1000	451.5	10000	PASS

Please refer to the following tables and plots.

**Non-Occupancy Period****Test Procedure**

Measure the EUT for more than 30 minutes following the channel close/move time to verify that the EUT does not resume any transmissions on this channel. Provide one plot to demonstrate no transmission on the channel for the non-occupancy period (30 minutes observation time)

**Results:**

Frequency (MHz)	Bandwidth (MHz)	Spectrum Analyzer Display

5510	40	No transmission within 30 minutes
5530	80	No transmission within 30 minutes

## Interference Detection Threshold

### Procedure:

The different steps below define the procedure to verify the Interference Detection Threshold during the Channel Availability Check Time.

- a) The signal generator and UUT are connected using Set-up A described in clause 5.3.8.1.2.1. The power of the UUT is switched off.
- b) The UUT is powered on at T0. T1 denotes the instant when the UUT has completed its power-up sequence (T<sub>power\_up</sub>) and is ready to start the radar detection. The channel Availability Check is expected to commence on Chr at instant T1 and is expected to end no sooner than T1+T<sub>ch\_avail\_check</sub> unless radar is detected sooner.

NOTE 1: Additional verification may be needed to define T1 in case it is not exactly known or indicated by the UUT.

- c) A single burst radar test signal is generated on Chr using any of the radar test signals defined in table D.4 at a level defined in clause 5.3.8.2.1. This single-burst radar test signal may commence at any time within the applicable Channel Availability Check Time.

NOTE 2: For the purpose of reducing test time, it is recommended that the single-burst test signal starts approximately 10 s after T1.

- d) It shall be recorded if the radar test signal was detected.
- e) The steps c) to d) shall be performed 20 times and each time a different radar test signal shall be generated from options provided in table D.4. The radar test signal shall be detected at least 12 times out of the 20 trials in order to comply with the detection probability specified for this frequency range in table D.5.

Where the declared channel plan includes channels whose nominal bandwidth falls completely or partly within the 5600 MHz to 5650 MHz band, additional testing as described in the steps below shall be performed on a channel within this band.

- f) A single burst radar test signal is generated on Chr using any of the radar test signals defined in table D.4 (except signals #3 and #4) at a level of 10 dB above the level defined in clause 5.3.8.2.1. This single burst radar test signal may commence at any time within the applicable Channel Availability Check Time.

NOTE 3: For the purpose of reducing test time, it is recommended that the single burst radar test signal starts approximately 10 s after T1.

- g) Step f) shall be performed 20 times, each time a different radar test signal shall be generated from options provided in table D.4 (except signals #3 and #4). The radar test signal shall be detected during each of these trials and this shall be recorded.

$$\text{Detection Ratio} = \frac{\text{Total Waveform Detections}}{\text{Total Waveform Trials}} \times 100$$

### Example of timing for radar testing during the Channel Availability Check

**Result:**

TestMode	Frequency[MHz]	Radar Type	Pass Times	Fail Times	Probability (%)	Limit (%)	Verdict
11A	5500	Type1~Type6	20	0	100.00	60	PASS

11AC80MIMO	5530	Type1~Type6	20	0	100.00	60	PASS

## In-Service Monitoring

### Procedure:

The steps below define the procedure to verify the In-Service Monitoring and Interference Detection Threshold during the In-Service Monitoring.

- a) When the UUT is a master device, a slave device will be used that associates with the UUT. The signal generator and the UUT are connected using Set-up A described in clause 5.3.8.1.2.1.

When the UUT is a slave device with a Radar Interference Detection function, the UUT shall associate with a master device. The signal generator and the UUT are connected using Set-up C described in clause 5.3.8.1.2.3.

- b) The UUT shall transmit a test transmission sequence in accordance with clause 5.1.2.2 on the selected channel Chr.
- c) At a certain time  $T_0$ , a single burst radar test signal is generated on Chr using radar test signal #1 defined in table D.4 and at a level defined in clause 5.3.8.2.1.  $T_1$  denotes the end of the radar burst.
- d) It shall be recorded if the radar test signal was detected.
- e) The steps b) to d) shall be performed 20 times. The radar test signal shall be detected at least 12 times out of the 20 trials in order to comply with the detection probability specified in table D.5.
- f) Step b) to e) shall be repeated for each of the radar test signals defined in table D.4 and as described in clause 5.3.8.1.1.

$$\text{Detection Ratio} = \frac{\text{Total Waveform Detections}}{\text{Total Waveform Trials}} \times 100$$
